

Final Project Demo

Problem: manual tracking.

Solution: single dashboard.

Focus: automation + testing.

1. Product Overview

- Who it is for
- What problem it solves

2. Live Demo

- Create event
- Register attendee
- Search and filter

3. Technical Proof

- Testing
- Error handling
- Architecture & maintenance

Keep the presentation short and spend most time on the working software demo.

Problem and Users

Target Users

- Student club leaders
- Campus staff
- Students registering for events

Problem Being Solved

- Manual tracking in spreadsheets or email
- Duplicate registrations and inconsistent counts
- No single dashboard for visibility

Key Features and Automation

Feature 1

- Create events with validation
- Structured inputs reduce bad data

Feature 2

- Register attendees
- Totals update automatically

Feature 3

- Search / filter events
- Lower user effort to find records

Automation worth highlighting in the demo:

- The system recalculates dashboard totals after each registration.
- Duplicate registrations for the same event are blocked automatically.
- Activity log messages show what the system did without extra user work.

Testing, Error Handling, and Code Quality

Unit Testing

- Validation rules
- Duplicate checks
- Metrics calculations

Integration Testing

- Create -> register -> reload
- Persistence verification

Error Handling

- Clear user messages
- Defensive validation
- Activity logging

Folder structure in the repository matches the instructor checklist:

1_code | 2_unit_testing | 3_integration_testing | 4_data_collection | 5_documentation

Architecture, Deployment, and Maintenance

System Architecture

Deployment

- Public GitHub repository
- Optional GitHub Pages live demo
- Browser-based execution

Maintenance Plan

- Corrective, adaptive, and perfective maintenance
- Modular JS files for easier updates
- Future upgrade path to Java + MySQL
